Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cathepsin K (EC 3.4.22.-) precursor - human

Nylternate names: cathepsin O2

C; Species: Homo sapiens (man)
R; Inside R; Sestiman Commun. 206, 89-96, 1387
B; Title: Molecular cloning of human cDNA for cathepsin K: Novel cysteine proteinase predct A; Reference number: JC2476
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Cross-references: UNIPROT: P43235; EMBL: X82153; NID: 9562756; PIDN: CAA57649.1; PID: 956275

(ANTI-) ANTIALIS SARL

Trehin Y; Terrasse G, Loria E,

WPI; 2002-750636/81. N-PSDB; AAL41281. Antiallergic compositions containing an anti-histamine, a histamine synthesis inhibitor, and optionally an allergen or nucleic acid coding for the allergen.

Claim 13; Page 30-31; 32pp; French.

The invention relates to antiallergic compositions containing an anti-histemaine, a histamine synthesis inhibitor, and obtionally an allergen or isolated nucleic acid molecule that has at least one polynucleotide sequence coding for the allergen, together with a pharmaceutical carrier.

```
composition (1) comprising a pharmaceutical carrier containing an active agent combination of at least two of: an allergen; an antihistemaine; and a histemaine synthesis inhibitor. (1) is used for treating or preventing allergic hypersensitivity reactions, especially allergic asthma, allergic frintis or allergic atopic eczema, in babies, children or adults. The present sequence is cysteine protesse from Dermatophagoides pteroniyasinus, which was used as an allergen in the invention
                                                                                                                                                                                                                                                                                                  61 ELVDCASQHGCHGDTIPRGIEYIQHNGVVQESYYRYVAREQSCRRPNAQRFGISNYCQIY 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          was obtd. in plasmid form as subclone from lambda gtll (Chua et al., J. Exp. Med. 167: 175-182 (1988)). The CDNA was used to express a Dep pl allergen which was capable of raising an immune response when contacted with anti-Dep pl antibodies. The protein was used to design a series of overlapping peptides synthesised by standard techniques to cover the whole Dermatophagoides pteronyssinus Dep pl sequence. The T cell epitopes

                                                                                                                                                                                                                                 83
The protein sequence was deduced from the cDNA sequence obtd. by screening a dermatophagoides cDNA library with two probes comprising the Der p 1 cDNA Bamil fragments 1-348 and 349-857. The protein allergen is used as a diagnostic reagent in detecting and treating sensitivity to house dust mites and in desensitisation therapy. See also AAR22431,2. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDNA encoding Dermatophagoides pteronyssinus group I allergen Dep pI

of the protein were mapped by detection of the peptide's ability to stimulate T cell activity. The peptides may be used for diagnosis and treatment of sensitivity to house dust mite allergens. When administered to house dust mite sensitive individuals, the peptides are capable of modifying the allergic response to the allergens. The peptides may be modified for e.g. increasing solubility, enhancing therapeutic or preventive efficacy or stability. See also ARA34686-700, AAR36398-490 and AAR39360-2. This sequence represents the group I protein allergen from the house dust mite D. pteronyssinus, Der pi. The Der pi protein shows high homology to the group I protein allergen derived from D. farinae, Der fi, having an identity of 81% Fragments of these proteins, and the corresponding group II allergens, Der pi II and Der fii, (see AARSI731-841) represent T carle epitopses. Fusion peptides may be produced which comprise at least two or these antigenic fragments. Each region of these petides may be (derived from the same, or different, mite allergens. The antigenic chair antigenicity. These peptides may be produced by chemical synthesis, chemical cleavage of the protein allergen or by recombinant techniques. These peptides, when administered to a house dust mite sensitive individual, are capable of modifying the allergic response of the individual to the allergen. These peptides do not bind to immuno-globulin CE (19E), or bind 19E to a lesser extent than the full length protein allergen. This reduces the major complications of standard immunotherapy, which are 19E-mediated responses such as anaphylaxis: Exposure of mite allergers and do not participate in mounting an immune response upon exposure. Administration of the peptide may also modify the lymphokine secretion profile as compared with exposure to the naturally occuring mite protein allergen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ELVDCASQHGCHGDTIPRGIEYIQHNGVVQESYYRYVAREQSCRRPNAQRFGISNYCQIY 120

AAR47063 is a preproenzyme Der pI. The amino acid sequence preceding the mature protein sequence contains cleavage sites for the pre- and procenzyme forms, with residues 1-11 corresponding to a partial signal peptide sequence. The mature protein can be used to detect sensitivity in an individual to house dust mitte and to reduce the sensitivity of the individual. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                       a compan. Contig. at least one cryptic peptide derived from that annigen. BIO mice were imunnised with various Der p I peptides and then response to Der p I and the peptides was measured in the presence of spheen adherent cells. Peptides contg. amino acids 120- 143 and 144-169 of Der p I were positive i.e., they contained cryptic epitopes. The cDNA fragment encoding amino acids 131-187 of Der p I was cloned into pGEX and expressed in bacteria as a fusion protein with glutathione-S-transferase. Mice were given orally 3 mg of this protein on 3 consecutive days, then 7 days later immunised subcutaneously with native Der p I in complete Freund's adjuvant. Seven days later lymph nodes, stimulated with protein or synthetic peptides, were assayed for lymphokines (IL-2). Mice given the cryptic epitope had a much weaker response than those treated only with buffer. (Updated on 25-MAR-2003 to correct PN field.)

The present invention describes peptides for treating sensitivity to house dust mite allergens from the genus Dermatophagoides. Peptides within the scope of the invention comprise at least one T cell epitope, or preferably at least two T cell epitopes of a protein allergen selected from the allergens Der P i. Der P ii, Der F i, or Der F ii. The invention also describes modified peptides having similar or enhanced therapeutic properties as the corresponding, naturally occurring allergen, but having reduced side effects. The present sequence represents Der P I from the present invention. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 27-AUG-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 ELVDCASQHGCHGDTIPRGIEYIQHNGVVQESYYRYVAREQSCRRPNAQRFGISNYCQIY 120

                                                                                                                                                                                                                                                                       This invention describes a novel method (I) for detecting whether an individual is sensitive to Dermatophagoides (house dust mites). The method involves detecting sensitivity to house dust mites in patients, comprising combining a blood sample from the individual with 1 or more isolated T cell epitopes of the protein allergens I and II (IPP I) and (IP II)) from Dermatophagoides (house dust mites). 32 T cell epitopes with varying, defined amino acids sequences (given in the specification) may be used in (I). The sample and allergens are combined under conditions appropriate for the binding of blood components with the polypeptides. The excent of binding is then indicative of the sensitivity of the patient to house dust mites. (I) may be used to screen individuals for sensitivity to Dermatophagoides (house dust mites). The house dust mite is a major cause of a variaty of allergic disorders such as asthma, rhinitis and eccopic dermatitis. This sequence represents the house dust

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated peptide of the major protein allergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der p (DP) I, DE II, Der f (DF) I or DE II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The regions are derived from the same or different protein allergen of the genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are also useful for detecting or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present sequence represents an allergenic protein from Dermatophagoides from which the T-cell epitope containing peptides are derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     60

The present invention relates to a new DNA encoding a peptide from
Dermatophagoides farinae protein allergen, designated Der f I or Der f
II, that comprises at least one epitope of the protein allergen. The
invention is useful for producing a peptide from Der f I or Der f II

protein allergen. The invention is also useful for diagnosing, treating
and preventing allergic responses to mite allergens, particularly, the
mites D. farinae. The invention is also useful as a probe for identifying
additional nucleotide sequences coding for mite allergens having amino
additional nucleotide sequences coding for mite allergens having amino
card sequences similar to Der f II. The peptide is useful for
detecting sensitivity in an individual to house dust mites and can be
used to treat sensitivity (reduce sensitivity or desensities) in an
individual, to whom therapeutically effective quantities of D. farinae
peptide is administered. The peptides when administered to sensitive
individual modify the individual's allergic response to Der f I or Der f
II. The peptides are useful as quarified allergens useful in the
standardisation of allergen extracts or preparations which can be used as
reagents for diagnosis and treatment of allergy to house dust mites. The
splitopic peptides are useful as diagnostic reagents for determining
reactivity to the mite species. The peptides are also useful for
identifying or defining T cell epitopes and/or B cell epitopes which are
clinicate the mediators or mechanisms of by which these reactions occur.
The present amino acid sequence represents the European house dust mite
Der D I protein as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein
                Dermatophagoides farinae protein allergen; Der f I; Der f II; allergy; allergic response; mite allergen; house dust mite; T cell epitope; B cell epitope; antiallergic; desensitisation therapy; modifies allergic response of house dust mite-sensitive individual; modify B-cell and/or T-cell response to Der f I and Der f II; Buropean house dust mite; Der p I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated DNA encoding peptide from Dermatophagoides farinae p. allergen, designated Der f I and Der f II, useful for treating and preventing allergic responses to mite allergens, by desensitization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure, Fig 7; 22pp; English.
                                                                                                                                                                           Dermatophagoides pteronyssinus.

mature protein sequence contains cleaved sites for the pre- and processyme forms, with residues 1-97 corresponding to a partial signal peptide sequence. The mature protein can be used to detect sensitivity in an individual to house dust mite and to reduce the sensitivity of the individual. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to an isolated peptide of the major protein alergens of the genus Dermatophagoides, which comprises at least one T cell group of a protein allergen from Der D (DP) I. Der I (DP) I or DF II. The isolated peptide comprises at least two regions, each region comprising at least one T cell group of a protein allergen of the genus Dermatophagoides. The peptides genus Dermatophagoides. The peptides are useful for treating house dust mite allergy in humans. The peptides are useful for treating or diagnosing sensitivity to house dust mite protein allergens. The present peptides have similar or enhanced therapeutic properties as the naturally-occurring allergen, but have reduced side effects, and increased solubility and stability. The present sequence represents an allergenic protein from Dermatophagoides from which the T-cell epitope containing peptides are derived, a polymorphic variant of Der p I. Note: The present sequence is not shown in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for the production of a recombinant mite Group 1 protein (1). The method comprises culturing a methyltrophic yeast microorganism transformed with a nucleic acid molecule (II) encoding (I), and recovering (I), or culturing Escherichia coli transformed with (II) under conditions in which (I) forms an inclusion body in E. coli, isolating the inclusion body, and recovering (I). Also described is a method for detecting mite allergy in an animal comprising: (a) contacting (I) with a putative IgE-containing substance of form a complex between (I) and IgE; and (b) determining the presence of reactive with (I) by detecting the complex, where the presence of reactive IgE is indicative of mite allergy in the animal (I) is useful
                                                                                                                                                9
                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing recombinant mite Group 1 protein for treating allergies, involves culturing a methyltrophic yeast microorganism or Escherichia coli transformed with nucleic acid molecule, and recovering the protein.
specification but is derived from the Der p I sequence shown in figure

The method comprises culturing a methyltrophic yeast microorganism transformed with a nucleic acid molecule (II) encoding (I), and recovering (I), or culturing Escherichia coli transformed with (II) under conditions in which (I) forms an inclusion body in E. coli, isolating the inclusion body, and recovering
for detecting mite allergy in an animal, or in a composition to reduce allergic response to a mite Group 1 protein in a mite allergic animal. (1) is also useful in a composition for treating or preventing allergic, infectious or other diseases. AAH22325 to AAH22394 and AAB98326 to AAB98349 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing recombinant mite Group 1 protein for treating allergies, involves culturing a methyltrophic yeast microorganism or Escherichia coli transformed with nucleic acid molecule, and recovering the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprising: (a) contacting (I) with a putative IgB-containing substance to form a complex between (I) and IgB; and (b) determining the presence of IgB reactive with (I) by detecting the complex, where the presence of reactive IgB is indicative of mite allergy in the animal. (I) is useful for detecting mite allergy in an animal, or in a composition to reduce allergy ic response to a mite Group 1 protein in a mite allergic animal. (I) is also useful in a composition for treating allergic, infectious or other diseases. AAH22326 to AAH22394 and AAB98326 to AAB98349 represent sequences used in the exemplification of the present
(I). Also described is a method for detecting mite allergy in an animal
